How DermaCheck works

A plain-language system map for business partners

Think of it as a digital front desk for skin concerns. It gathers the right details, helps a person understand what may need attention, and points them toward care. A clinician still makes the medical decision.

THE JOURNEY TODAY

01 · PERSON

Describes the concern

Enters symptoms, body area, duration and city. A skin photo is optional.

›

02 · WEBSITE

Collects the details

The mobile-friendly page checks the form and sends it to the server.

›

03 · SERVER

Coordinates the request

Checks file and text limits, then asks an external AI service to review the information.

›

04 · AI + SEARCH

Returns two kinds of help

Possible explanations and warning flags; search-backed local clinic suggestions.

›

05 · PERSON

Chooses the next step

Reads the screening summary and contacts a qualified clinician if needed.

WHO RUNS WHICH PART?

Vercel hosts the website and API. **Google's Gemini API** processes the screening request; Google Search grounding supports care suggestions. **A dermatologist** would provide diagnosis and treatment in a separate consultation.

WHAT IS LIVE—AND WHAT IS NOT?

Live: guided intake, optional photo, AI-assisted summary, alerts and clinic suggestions. There is **no doctor review, appointment booking, verified provider directory or patient-record system** in the current prototype.

BEFORE A REAL SERVICE LAUNCH

- Have clinicians validate safety and review high-risk cases.
- Verify clinic listings and add a clear consent/privacy flow.
- Add rate limits, monitoring and a plan for API outages.
